Chapter 5: Algorithms

- ☐ **The Concept of an Algorithm**
- ☐ **Algorithm Representation**
- ☐ **Algorithm Discovery**
- ☐ **Iterative Structures**

- ☐ Recursive Structures
- ☐ Efficiency and Correctness

2

Definition of Algorithm

An algorithm is an **ordered** set of **unambiguous, executable** steps that defines a **terminating** process.

3

Algorithm Representation

- Requires well-defined primitives
- A collection of primitives constitutes a programming language.

Copyright © 2012/ 2015 Pearson Education, Inc. Modified for UB-CMPS1134 (DGV2015, Rev18S1)

4

6

Pseudocode Primitives

□ Assignment

name \leftarrow *expression*

e.g.

sum \leftarrow total1 + total 2

□ Conditional selection

if (condition) **then** (activity) **else** (activity)

e.g.

if (not raining)

then (go for a walk)

else (watch television)

Copyright © 2012/ 2015 Pearson Education, Inc. Modified for UB-CMPS1134 (DGV2015, Rev18S1)

7

Pseudocode Primitives (cont)

□ Repeated execution

while (*condition*) **do** (*activity*)

e.g.

while (tickets remain to be sold) **do**
(sell a ticket)

□ Procedure

procedure *name* (*parameters*)

e.g.

procedure ProcessLoan

procedure Sum (total1, total2)

Copyright © 2012/ 2015 Pearson Education, Inc. Modified for UB-CMPS1134 (DGV2015, Rev18S1)

8

Pseudocode Primitives (cont)

- Indentation shows **nested** conditions

```

if (not raining)
  then (if (temperature = hot)
    then (go swimming)
    else (play golf))
  else (watch television)
  
```

9

Figure 5.4 The procedure Greetings in pseudocode

```

procedure Greetings
  Count  $\leftarrow$  3;
  while (Count > 0) do
    (print the message "Hello" and
     Count  $\leftarrow$  Count -1)
  
```

10

Polya's Problem Solving Steps

1. Understand the problem.
2. Devise a plan for solving the problem.
3. Carry out the plan.
4. Evaluate the solution for accuracy and its potential as a tool for solving other problems.

11

Getting a Foot in the Door

- ☐ Try working the problem backwards
- ☐ Solve an easier related problem
 - Relax some of the problem constraints
 - Solve pieces of the problem first (bottom up methodology)
- ☐ Stepwise refinement: Divide the problem into smaller problems (top-down methodology)

12

Ages of Children Problem

- Person A is charged with the task of determining the ages of B's three children.

- B tells A that the product of the children's ages is 36.
- A replies that another clue is required.
- B tells A the sum of the children's ages (we are not told what it is)
- A replies that another clue is needed.
- B tells A that the oldest child plays the piano.
- A tells B the ages of the three children.

a. Triples whose product is 36

(1,1,36)	(1,6,6)
(1,2,18)	(2,2,9)
(1,3,12)	(2,3,6)
(1,4,9)	(3,3,4)

b. Sums of triples from (a)

1+1+36=38
1+2+18=21
1+3+12=16
1+4+9=14
1+6+6=13
2+2+9=13
2+3+6=11
3+3+4=10

- How old are the three children?

13

Iterative Structures

- **Pretest loop:**

```
while (condition) do
    (loop body)
```

No assumption made for first iteration

```
while (there is a coin in your pocket) do
    (take coin from your pocket)
```

- **Posttest loop:**

```
repeat (loop body)
until (condition)
```

Assumption made for first iteration

```
repeat (take a coin from your pocket)
until (there are no coins in your pocket)
```

14

Figure 5.7 **Components of repetitive control**

Initialize: Establish an initial state that will be modified toward the termination condition

Test: Compare the current state to the termination condition and terminate the repetition if equal

Modify: Change the state in such a way that it moves toward the termination condition

17

Figure 5.6 The sequential search algorithm in pseudocode

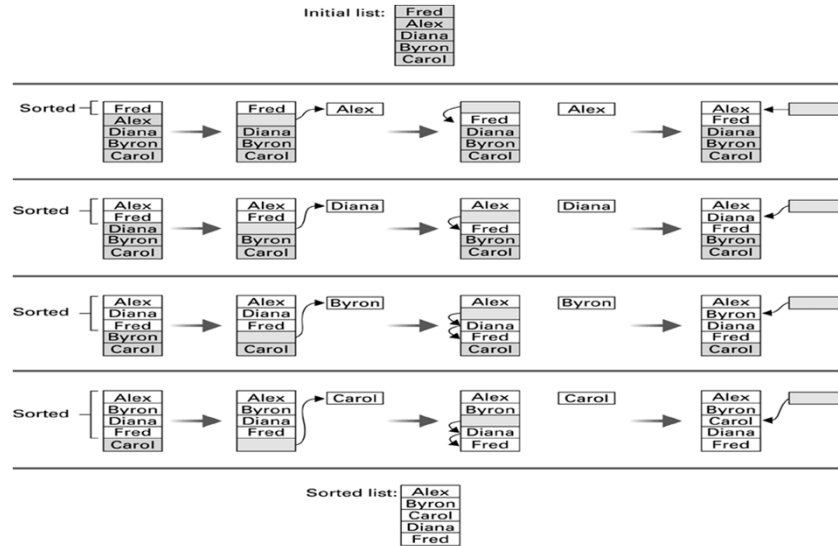

```

procedure Search (List, TargetValue)
  if (List is empty)
    then (Declare search a failure)
  else
    (Select the first entry in List to be TestEntry)
    while (TargetValue > TestEntry and entries remain)
      do (Select the next entry in List as TestEntry)
    if (TargetValue = TestEntry)
      then (Declare search a success)
    else (Declare search a failure)
  
```

19

Figure 5.11 The insertion sort algorithm expressed in pseudocode

procedure Sort (List)

$N \leftarrow 2$;

while (the value of N does not exceed the length of List) **do**

 (Select the N th entry in List as the pivot entry;

 Move the pivot entry to a temporary location leaving a hole in List;

while (there is a name above the hole and that name is greater than the pivot) **do**

 (move the name above the hole down into the hole leaving a hole above the name)

 Move the pivot entry into the hole in List;

$N \leftarrow N + 1$

)
