Chapter 8: Data Abstractions

- ☐ **Data Structure Fundamentals**
- ☐ **Related Concepts**
- ☐ **Implementing Data Structures**
 - **Storing Arrays**
 - **Storing Lists**
- ☐ **Implementing Data Structures (continued)**
 - Storing Stacks and Queues
 - Storing Binary Trees
 - Manipulating Data Structures
- ☐ A Short Case Study
- ☐ Customized Data Types
- ☐ Classes and Objects
- ☐ Pointers in Machine Language

3

Basic Data Structures

Terminology for Arrays

- ☐ **Homogeneous Array:**
A "rectangular" block of data whose entries are of same type.
 - ☐ May have multiple **dimensions**.
Example: A two-2 dimensional array consists rows and columns
 - ☐ **Indices** are used to identify positions (i, j)
- ☐ **Heterogeneous Array (or Aggregate):** A block of data items that might be of different type or sizes.
 - ☐ Each data item is called a **field**
 - ☐ Fields are usually accessed by name

4

Basic Data Structures

Terminology for Lists

List:

A collection of data whose entries are arranged sequentially

□ **Head:** The beginning of the list

□ **Tail:** The end of the list

Copyright © 2012/ 2015 Pearson Education, Inc. Modified for UB-CMPS1134 (DGV2015, Rev18S1)

5

Basic Data Structures

Terminology for Stacks

Stack:

A list in which entries are removed and inserted only at the head

□ **LIFO:** Last-in-first-out

□ **Top:** The head of list (stack)

□ **Bottom** or **base:** The tail of list (stack)

□ **Pop:** To remove the entry at the top

□ **Push:** To insert an entry at the top

Copyright © 2012/ 2015 Pearson Education, Inc. Modified for UB-CMPS1134 (DGV2015, Rev18S1)

6

Basic Data Structures

Terminology for Queues

Queue:

A list in which entries are removed at the head and are inserted at the tail

❑ **FIFO:** First-in-first-out

Copyright © 2012/ 2015 Pearson Education, Inc. Modified for UB-CMPS1134 (DGV2015, Rev18S1)

7

Basic Data Structures

Terminology for a Tree

Tree:

A collection of data whose entries have a hierarchical organization

❑ **Node:** An entry in a tree

❑ **Root node:** The node at the top

❑ **Terminal or leaf node:** A node at the bottom

Copyright © 2012/ 2015 Pearson Education, Inc. Modified for UB-CMPS1134 (DGV2015, Rev18S1)

8

Basic Data Structures

Terminology for a Tree (cont)

- ❑ **Parent:**
The node immediately above a specified node
- ❑ **Child:**
A node immediately below a specified node
- ❑ **Ancestor:**
Parent, parent of parent, etc.
- ❑ **Descendent:**
Child, child of child, etc.
- ❑ **Siblings:**
Nodes sharing a common parent

9

Basic Data Structures

Terminology for a Tree (cont)

- ❑ **Binary tree:**
A tree in which every node has at most two children
- ❑ **Depth:**
The number of nodes in longest path from root to leaf
- ❑ **Subtree:**
A node together with all the nodes below it. Each subtree is a **branch** from its parent.

11

Related Concepts

□ Abstraction

- Shield users (application software) from details of actual data storage

□ Static vs. Dynamic Structure

- Does the shape and size change over time?

□ Pointer

- A storage area that encodes an address where data is stored
- Later used to access the data

12

Implementing Data Structures

Different techniques are used for storing data structures in a computer's main memory.

We look at:

- ☐ **Storing Arrays** (homo/heterogeneous)
- ☐ **Storing Lists**
- ☐ Storing Stacks and Queues
- ☐ Storing Binary Trees
- ☐ Manipulating Data Structures

13

Implementing Data Structures

Storing Homogeneous Arrays

Memory address of a particular cell can be computed

- ☐ **Row-major order** versus **column major order**
 - Row major order (by rows) used in most languages: 3,4,7,6,2,5,1,3,8
 - Column major order (by columns) used in Fortran: 3,6,1,4,2,3,7,5,8
- ☐ **Address polynomial**
 - $(c \times (i-1)) + (j-1)$
 - Cell size (c) multiplied by the number of rows ($i-1$) above an element, plus the number of elements to the left of the element ($j-1$)

3	4	7
6	2	5
1	3	8

	1	2	...	$j-1$	j	...	n

15

Implementing Data Structures

Storing Homogeneous Arrays

Two-dimensional array with four rows and five columns stored in row major order (Fig 8.6)

Copyright © 2012/ 2015 Pearson Education, Inc. Modified for UB-CMPS1134 (DGV2015, Rev18S1)

16

Implementing Data Structures

Storing Heterogeneous Arrays

- Fields can be stored one after the other in a contiguous block:
 - Memory cell address of each field can be computed
- Fields can be stored in separate locations identified by pointers

Copyright © 2012/ 2015 Pearson Education, Inc. Modified for UB-CMPS1134 (DGV2015, Rev18S1)

17

Implementing Data Structures

Storing Heterogeneous Array Employee

a. Array stored in a contiguous block

b. Array components stored in separate locations

Copyright © 2012/ 2015 Pearson Education, Inc. Modified for UB-CMPS1134 (DGV2015, Rev18S1)

18

Implementing Data Structures

Storing Lists

- ❑ **Contiguous list:** List stored in a homogeneous array
- ❑ **Linked list:** List in which each entries are linked by pointers
 - **Head pointer:** Pointer to first entry in list
 - **null pointer:** A "non-pointer" value used to indicate end of list

Copyright © 2012/ 2015 Pearson Education, Inc. Modified for UB-CMPS1134 (DGV2015, Rev18S1)

19

Implementing Data Structures - Storing Lists

Names stored in memory as a contiguous list

(Fig 8.8)
